

Studies of the $\omega\pi\pi$ Final State at GlueX

Amy M. Schertz (for the GlueX Collaboration)

June 2019

Signals for exotic mesons, which have quantum numbers that aren't allowed for a quark-antiquark pair, have been experimentally observed, but their exact nature is still unknown. A candidate for these exotics is the hybrid meson, which consists of a quark, an antiquark, and an excited gluon. GlueX, a photoproduction experiment in Jefferson Lab's Hall D, aims to map the spectrum of light quark mesons by studying a multitude of final states allowed by the detector's large acceptance. Evidence for the lightest expected exotic hybrid meson has been shown in a partial wave analysis of the $\omega\pi\pi$ final state in pion production. In this talk, studies of the reaction $\gamma p \rightarrow \omega\pi\pi p$ at GlueX will be presented.
