

# Status of the PRad Experiment at JLab

A. Gasparian  
NC A&T State University, NC USA

for the PRad collaboration

## Outline

- PRad goals and specifics
- Experimental setup
- Status of the run and the data quality
- Summary

# Extraction of $r_p$ from $ep \rightarrow ep$ Experiments

- In the limit of first Born approximation the elastic  $ep$  scattering (one photon exchange):

$$\frac{d\sigma}{d\Omega} = \left( \frac{d\sigma}{d\Omega} \right)_{\text{Mott}} \left( \frac{E'}{E} \right) \frac{1}{1+\tau} \left( G_E^p{}^2(Q^2) + \frac{\tau}{\varepsilon} G_M^p{}^2(Q^2) \right)$$

$$Q^2 = 4EE' \sin^2 \frac{\theta}{2} \quad \tau = \frac{Q^2}{4M_p^2} \quad \varepsilon = \left[ 1 + 2(1+\tau) \tan^2 \frac{\theta}{2} \right]^{-1}$$

- Structureless proton:

$$\left( \frac{d\sigma}{d\Omega} \right)_{\text{Mott}} = \frac{\alpha^2 [1 - \beta^2 \sin^2 \frac{\theta}{2}]}{4k^2 \sin^4 \frac{\theta}{2}}$$

- $G_E$  and  $G_M$  were extracted using Rosenbluth separation (or at extremely low  $Q^2$  the  $G_M$  can be ignored, like in the PRad experiment)
- The Taylor expansion at low  $Q^2$ :

$$G_E^p(Q^2) = 1 - \frac{Q^2}{6} \langle r^2 \rangle + \frac{Q^4}{120} \langle r^4 \rangle + \dots$$

$$\langle r^2 \rangle = -6 \frac{dG_E^p(Q^2)}{dQ^2} \Big|_{Q^2=0}$$

- ✓ Definition of the Proton Radius:

$$\langle r^2 \rangle = \int \rho(r) r^2 dr$$

- ✓ Extraction of the Proton Radius:

(r.m.s. charge radius given by the slope):

# A New $ep \rightarrow ep$ Experiment?

❑ Practically all  $ep$ -experiments are done with magnetic spectrometers!

- Limitation on minimum  $Q^2$ :  $10^{-3} \text{ GeV/C}^2$ 
  - ✓ limitation on min. scattering angle:  $\theta_e \approx 5^\circ$
  - ✓ Typical beam energies:  $\sim 1 \text{ GeV}$
- Absolute cross section measurement is needed ( $d\sigma/d\Omega$ ):
  - ✓ Statistics is not a problem ( $<0.2\%$ )
  - ✓ Control of systematic errors???
    - electron beam flux;
    - target thickness and windows;
    - geometrical acceptances;
    - detection efficiencies, ...
    - Typical uncertainty:  $\sim 2 \div 3\%$
- A possible solution (the PRad approach):
  - ✓ Non-magnetic-spectrometer method
  - ✓ No target windows
  - ✓ Calibrate with other well-known QED processes

Three spectrometer facility of the A1 collaboration:

Mainz magnetic spectrometers

# PRad Experiment

## ■ Experimental goals:

- reach to very low  $Q^2$  range ( $\sim 10^{-4}$  GeV/C<sup>2</sup>)
- reach to sub-percent precision in cross section

## ■ Suggested solutions:

- ✓ use high resolution high acceptance calorimeter:
  - ❖ reach smaller scattering angles: ( $\Theta = 0.7^\circ - 7.0^\circ$ )  
( $Q^2 = 1 \times 10^{-4} - 6 \times 10^{-2}$ ) GeV/c<sup>2</sup>  
large  $Q^2$  range in one experimental setting!  
essentially, model independent  $r_p$  extraction
- ✓ Simultaneous detection of  $ee \rightarrow ee$  Moller scattering
  - ❖ (best known control of systematics)
- ✓ Use high density windowless H<sub>2</sub> gas flow target:
  - ❖ beam background fully under control
  - ❖ minimize experimental background

Recent Mainz low  $Q^2$  data set

- Two beam energies:  $E_0 = 1.1$  GeV and 2.2 GeV to increase  $Q^2$  range
- Will reach sub-percent precision in  $R_p$  extraction
- Approved by JLab PAC39 (June, 2012) with high “A” scientific rating

# PRad Experimental Setup (schematics)

## ■ Main detector elements:

- windowless  $\text{H}_2$  gas flow target
- PrimEx HyCal calorimeter
- vacuum box with one thin window at HyCal end
- X,Y – GEM detector on front of HyCal

## ■ Beam line equipment:

- standard beam line elements (0.1 – 10 nA)
- photon tagger for HyCal calibration
- collimator box (6.4 mm collimator for photon beam, 12.7 mm for  $e^-$  beam halo “clean-up”)
- Harp 2H00
- pipe connecting Vacuum Window through HyCal

# PRad Experimental Setup Installed in the Hall B Beam Line

Beam-down view

Beam-side view

- Beam line installation completed in May of 2016

# Windowless H<sub>2</sub> Gas Flow Target (Schematics)

- A **windowless** gas target of cryogenically cooled hydrogen
  - Target cell is 4 cm long copper, attached to cryocooler via heat strap
  - Cell diameter: 8 cm
  - Cell covers are 7.5  $\mu\text{m}$  kapton with 2 mm beam orifices
  - Two additional solid target foils:
    - 1  $\mu\text{m}$  carbon*
    - 1  $\mu\text{m}$  aluminum*

- Four-axis motion system to position the target cell with 10  $\mu\text{m}$  accuracy

# Windowless H<sub>2</sub> Gas Flow Target Cell

## Target Cell:

- length 4 cm
- diameter 8 cm with 2 mm diameter holes for the beam to pass through
- Cell pressure 500 mtorr
- H<sub>2</sub> input gas temp. 19.5 K
- Areal density:  $2 \times 10^{18}$  H atoms / cm<sup>2</sup>
- vacuum in target chamber ~3 mtorr

Cell orifice

# Windowless $\text{H}_2$ Gas Flow Target Installed in Hall B Beam Line

e - beam  
↗

Target installed in Hall B beam line, May 2016

# Windowless H<sub>2</sub> Gas Flow Target (Cont'd)

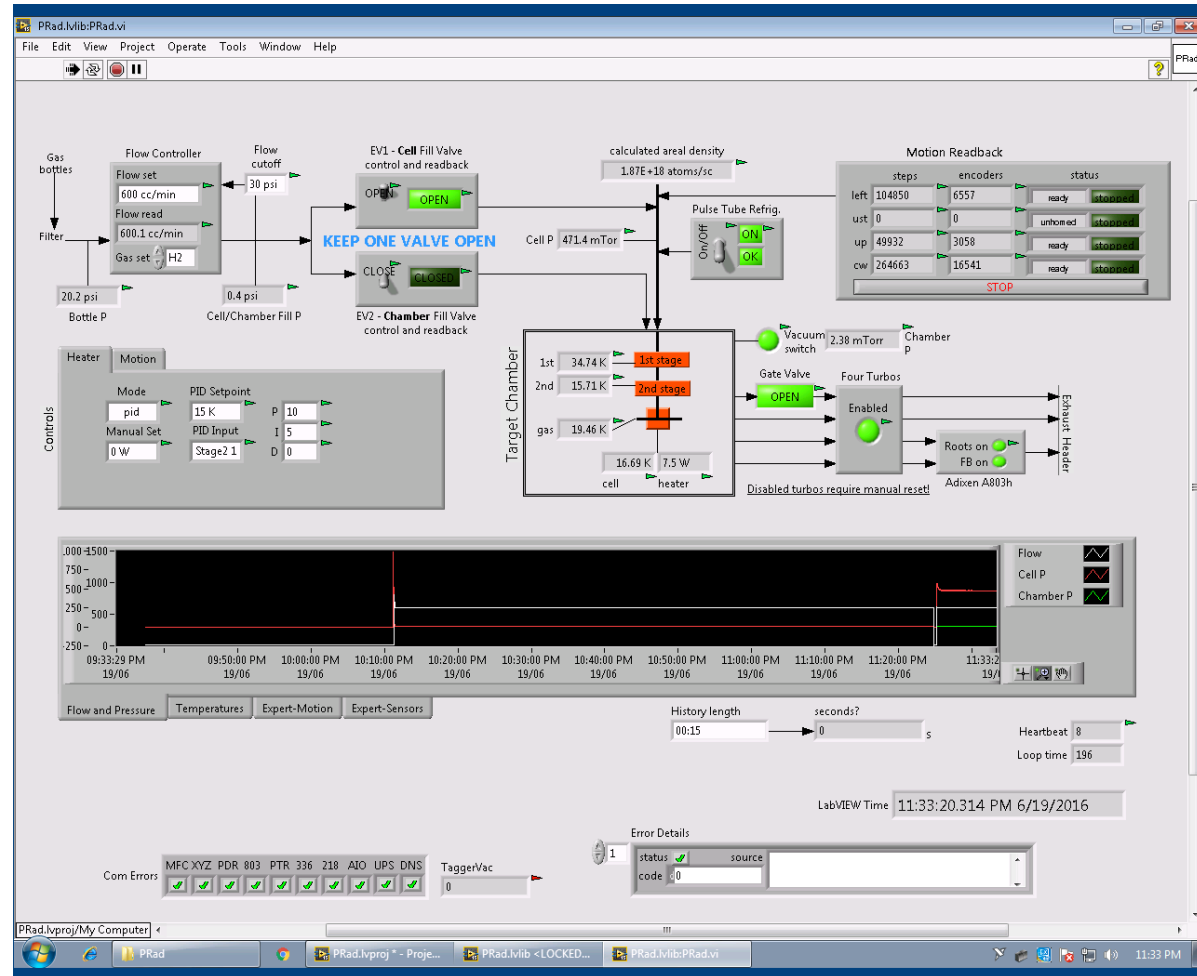

✓  $1.8 \times 10^{18}$  H atoms/cm<sup>2</sup>

cell pressure: 471 mtorr

chamber pressure: 2.34 torr

cell vs. chamber pressures:

**200:1** has been reached;

# Electromagnetic Calorimeter (PrimEx HyCal)

- Combination of  $\text{PbWO}_4$  and Pb-glass detectors ( $118 \times 118 \text{ cm}^2$ )
  - 34 x 34 matrix of  $2.05 \times 2.05 \times 18 \text{ cm}^3$   $\text{PbWO}_4$  shower detectors
  - 576 Pb-glass shower detectors ( $3.82 \times 3.82 \times 45.0 \text{ cm}^3$ )
  - 2 x 2  $\text{PbWO}_4$  modules removed in middle for beam passage
  - 5.5 m from  $\text{H}_2$  target ( $\sim 0.5 \text{ sr}$  acceptance)
  
- Resolutions:
  - for  $\text{PbWO}_4$  shower detectors:
    - ✓ energy:  $\sigma/E = 2.6 \text{ } \%/ \sqrt{E}$
    - ✓ position:  $\sigma_{xy} = 2.5 \text{ mm} / \sqrt{E}$
  - for Pb-glass shower detectors factor of  $\sim 2.5$  worse

PbWO4 crystal cell

# Electromagnetic Calorimeter in Hall B beam Line

# GEM Coordinate Detectors

- Tasks for GEM:
  - factor of **>20 improvements in coordinate resolutions**
  - similar improvements in  $Q^2$  resolution (**very important**)
  - unbiased coordinate reconstruction (including HyCal transition region)
  - increase  $Q^2$  range by including HyCal Pb-glass part
- Designed and built at University of Virginia (UVa)
- Two large size GEM X and Y- coordinate detectors with 100  $\mu\text{m}$  position resolution

## GEM Coordinate Detectors (Cont'd)

2 GEM detectors installed in Hall B beam line, May 2016

# Vacuum Box

2-stage vacuum box in Hall B beam line

1.7 m diameter, 2 mm Al vacuum window

# The CEBAF Electron Beam at JLab

## (beam profile at the target)

- Done by “harp” scan before the target;  
typical size: 20  $\mu\text{m}$

# The CEBAF Electron Beam at JLab

- Beam current monitoring (55 nA)

- X and Y position stability ( $\pm 0.1$  mm)

# The CEBAF Electron Beam at JLab

## (energy stability)

- Beam energy monitoring,  $E_e = 2147.4$  MeV ( $\Delta E/E = \pm 5 \times 10^{-4}$ )

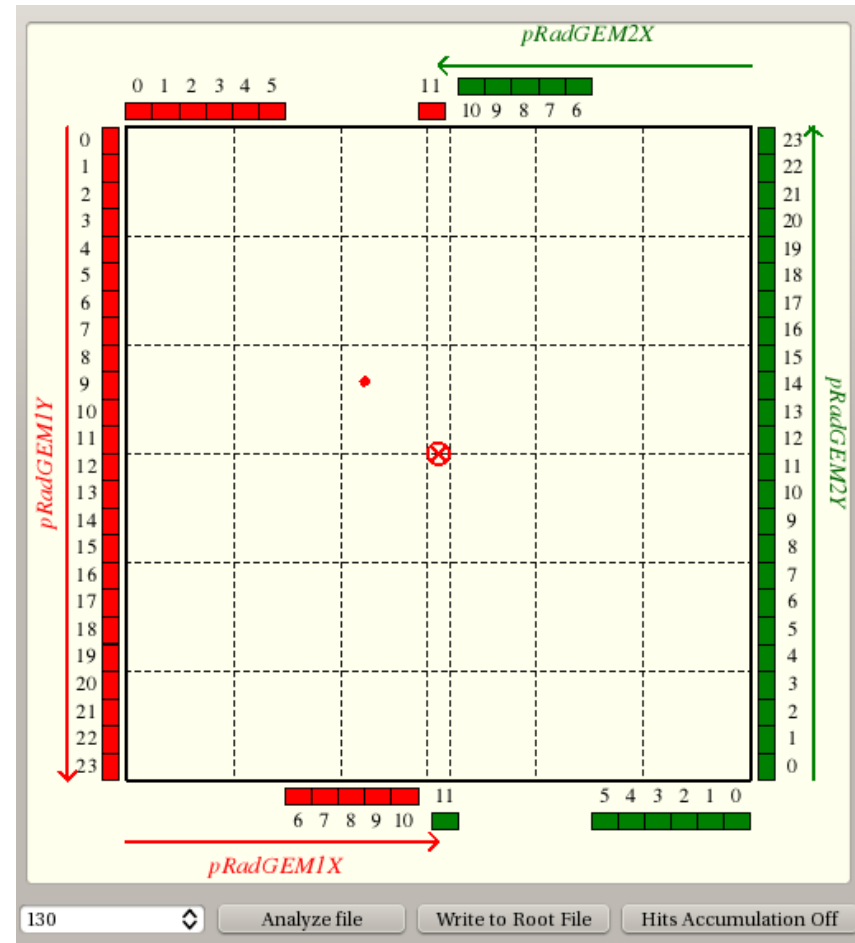

# Experimental Data Collected

## (May/June 2016 Run)

- with  $E_e = 1.1$  GeV beam:
  - ✓ 4.2  $\mu\text{C}$  (target areal density:  $2 \times 10^{18}$  H atoms/cm<sup>2</sup>)
  - ✓ 604 M events with target;
  - ✓ 53 M events with “empty” target;
  - ✓ 25 M events with  $^{12}\text{C}$  target for calibration.
  
- with  $E_e = 2.2$  GeV beam:
  - ✓ 4.2  $\mu\text{C}$  (target areal density:  $2 \times 10^{18}$  H atoms/cm<sup>2</sup>)
  - ✓ 756 M events with target;
  - ✓ 38 M events with “empty” target;
  - ✓ 10.5 M events with  $^{12}\text{C}$  target for calibration.

# Fresh Results from On-Line Analysis (HyCal-GEM single-cluster event matching)

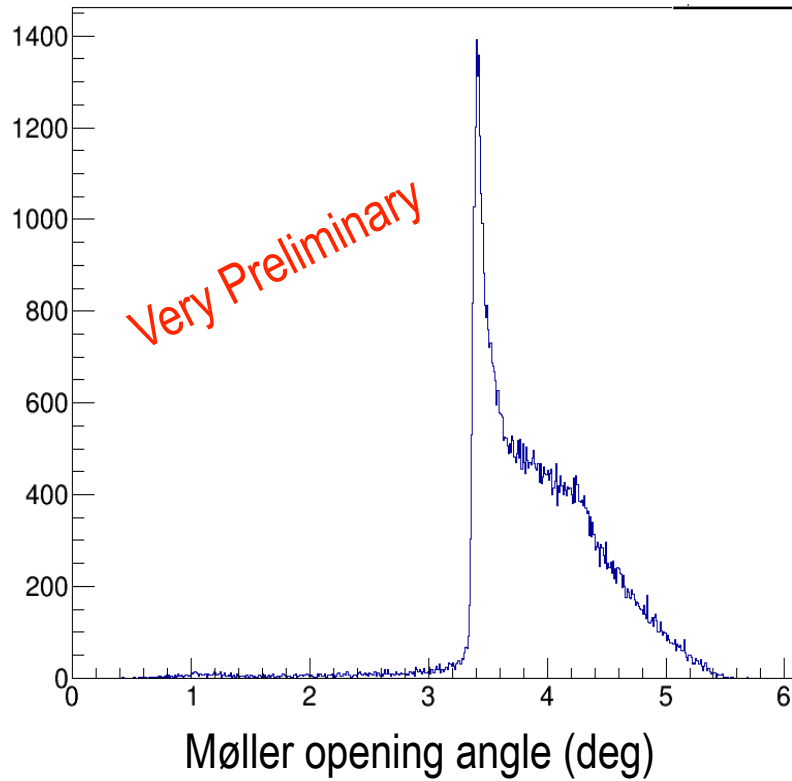

# Fresh Results from On-Line Analysis (HyCal-GEM double-cluster event matching)

# Fresh Results from On-Line Analysis

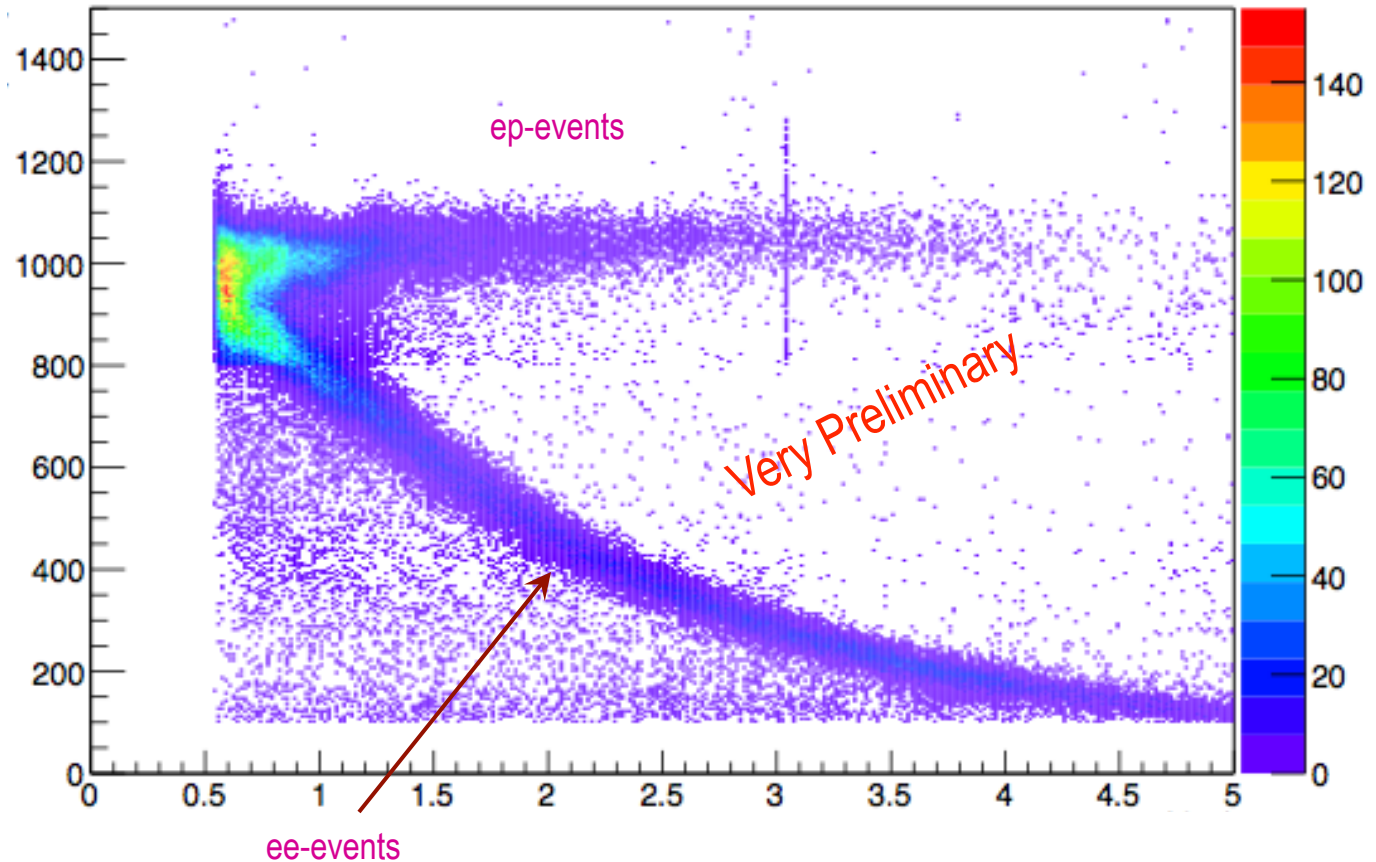

(clear signature of Moller events)

# Fresh Results from On-Line Analysis

(2D distribution of cluster energy vs. scattering angle)

$$E_0 = 1.1 \text{ GeV}$$

# PRad Collaboration Institutional List

- Currently 16 collaborating universities and institutions

Jefferson Laboratory  
NC A&T State University  
Duke University  
Idaho State University  
Mississippi State University  
Norfolk State University  
University of Virginia  
Argonne National Laboratory  
University of North Carolina at Wilmington  
University of Kentucky  
Hampton University  
College of William & Mary  
Tsinghua University, China  
Old Dominion University  
ITEP, Moscow, Russia  
Budker Institute of Nuclear Physics , Novosibirsk, Russia

# Summary

- PRad was uniquely designed to address the “*Proton Radius Puzzle*”
- Experiment had been performed in May/June of 2016
- Large statistics, high quality, rich data have been collected:
  - ✓ Lowest  $Q^2$  data set ( $\sim 10^{-4} \text{ GeV}^2/\text{C}^2$ ) has been collected for the first time in ep-scattering experiments;
  - ✓ Simultaneous measurement of Moller and Mott scattering processes has been demonstrated to control systematic uncertainties.
- Data analysis has been started, first preliminary results for this year is possible
  - PRad is supported in part by NSF MRI award #PHY-1229153 as well as DOE awards for GEM
  - my research work is supported in part by NSF awards: PHY-1506388 and PHY-0855543

# The End

# Estimated Uncertainties

Contributions	Estimated Error (%)
Statistical error	0.2
Acceptance (including $Q^2$ determination)	0.4
Detection efficiency	0.1
Radiative corrections	0.3
Background and PID	0.1
Fitting error	0.2
Total Error	0.6%

- Estimated error budget (added quadratically)

## Windowless H<sub>2</sub> Gas Flow Target (Cont'd)

- ✓ add one turbo as backing pump;
- ✓ add one more roots blower;
- ✓ ran with H<sub>2</sub> gas at 17 K
- ✓ Cell vs. chamber pressures: 200:1 has been reached
