

# Update on SBS GEM prototypes tests at FNAL (Oct. 2013) and JLab (March 2014)

Kondo Gnanvo

# Outline

- Preliminary results from the GEM tests at JLab (March 2014)
  - Performances of the SBS GEM Modules
  - Preliminary results on APV25 electronics latency and timing
- Update on the GEM tests at FNAL Test Beam (October 2013)
  - Spatial resolution of SBS GEM
  - Efficiency of the SBS GEM modules

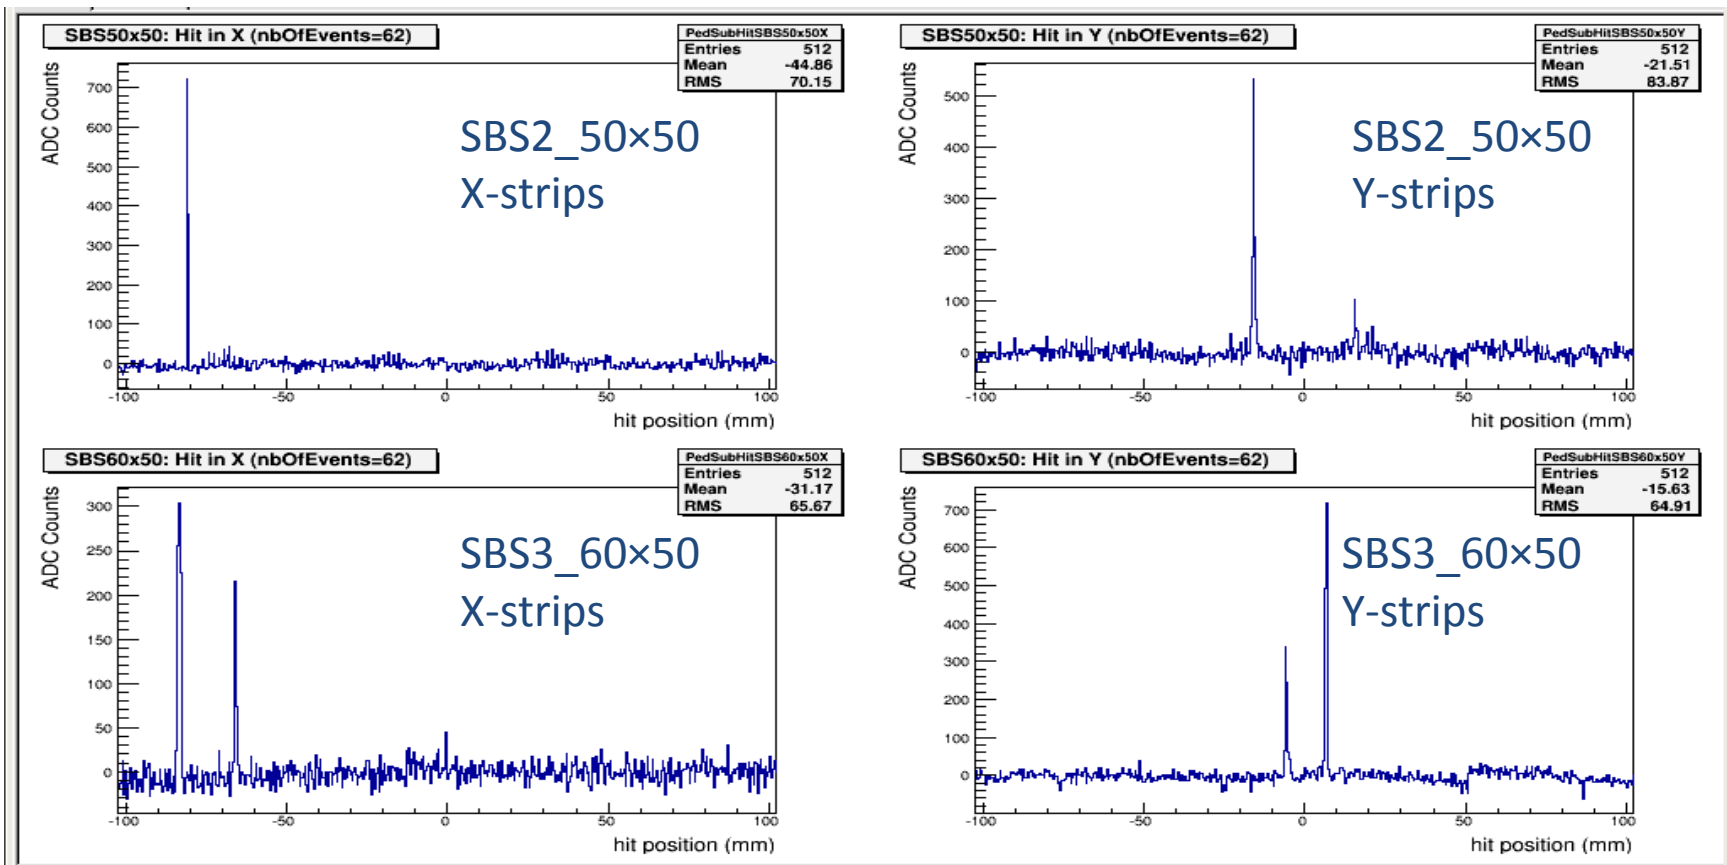

# UVa GEMs @ JLab Test Beam (March 2014):

- **Two SBS GEM Module:** SBS2 ( $50 \times 50 \text{ cm}^2$ ) and SBS3 ( $60 \times 50 \text{ cm}^2$ );
- $20 \times 20 \text{ cm}^2$  read out during the test
- **Trigger:** Coincidence between PMT-Scintillators upstream and Lead Glass downstream
- **Readout System:** APV25-SRS + DATE DAQ

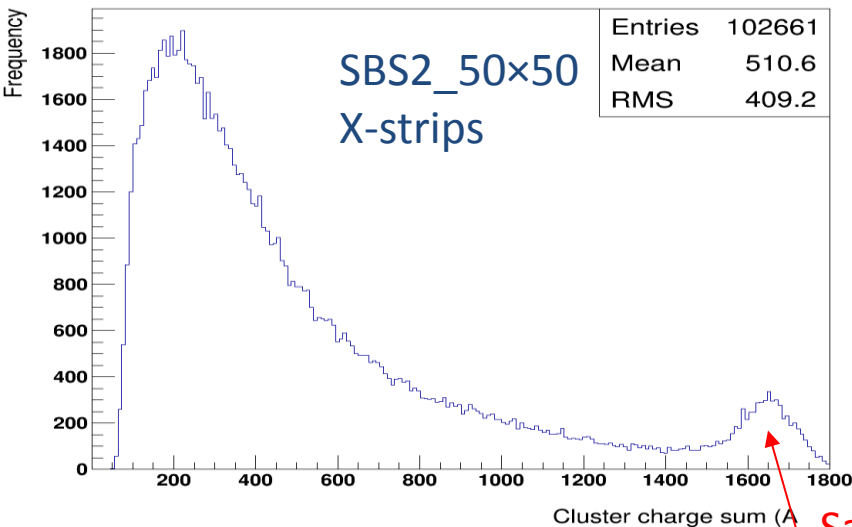

# UVa GEMs @ JLab Test Beam: Typical event

- Data on April 02, 2014: Last day of the beam in Hall A
- CW beam with Carbon target: very low intensity → low trigger rate
- Gas mixture ArCO<sub>2</sub> (75/25) → 3950 kV on the divider
- 64 K Events saved into raw data files with APV25-SRS → with 6 apv25 time sample

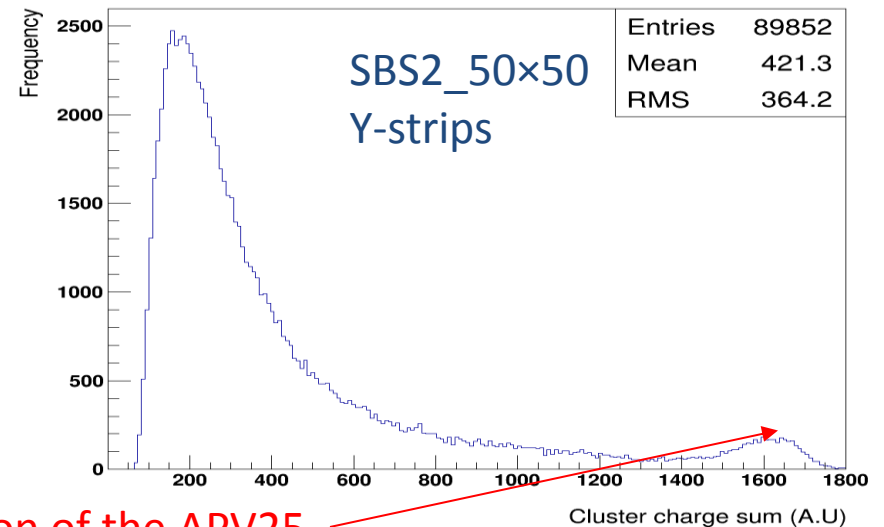

# UVa GEMs @ JLab Test Beam: ADC distribution plots

SBS50x50 cluster Charge Distr in X-Strips (53918 / 64000)

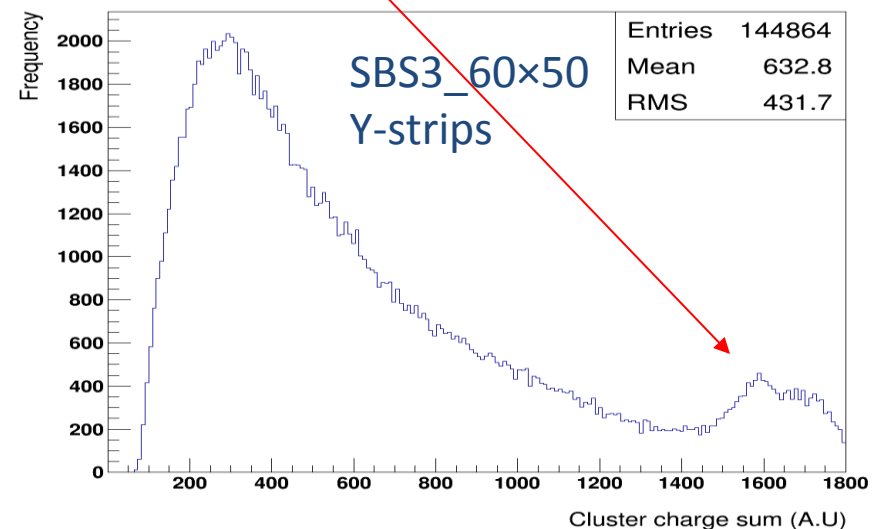

SBS50x50 cluster Charge Distr in Y-strips (51937 / 64000)

SBS60x50 cluster Charge Distr in X-Strips (52010 / 64000)

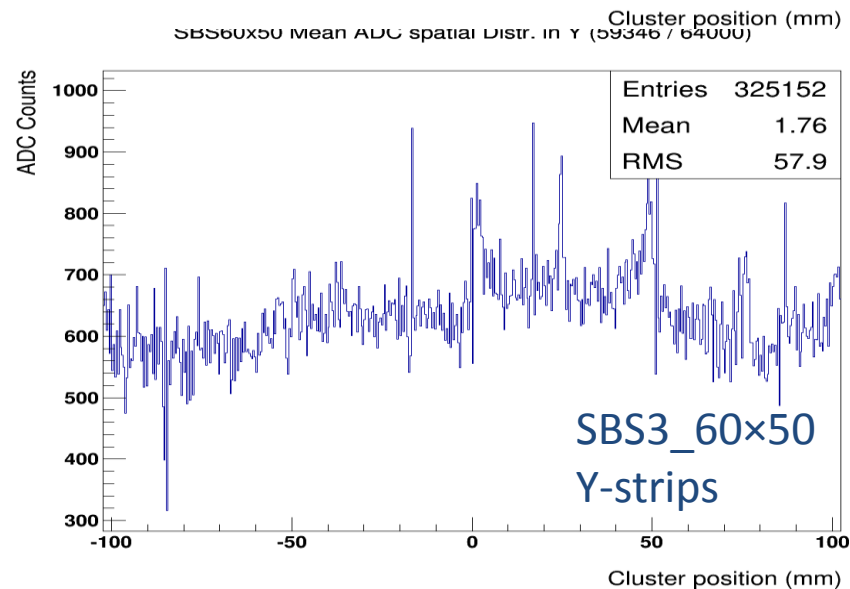

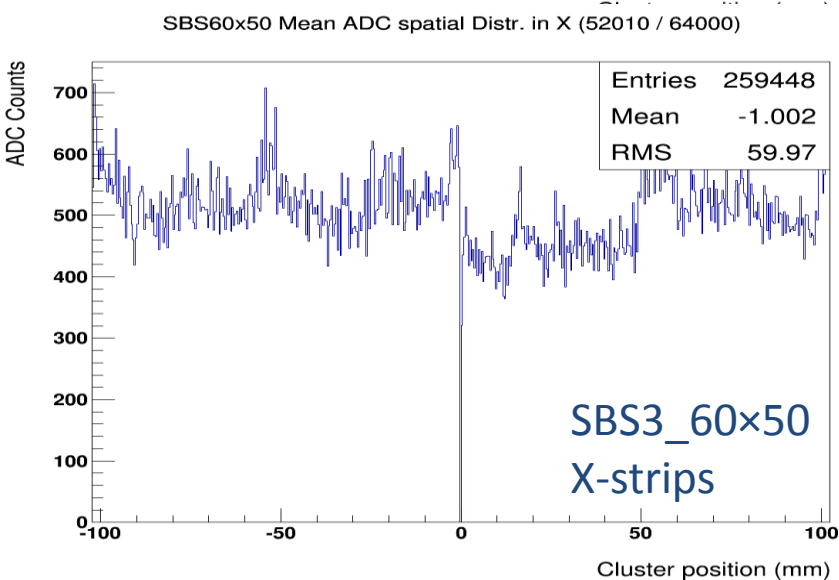

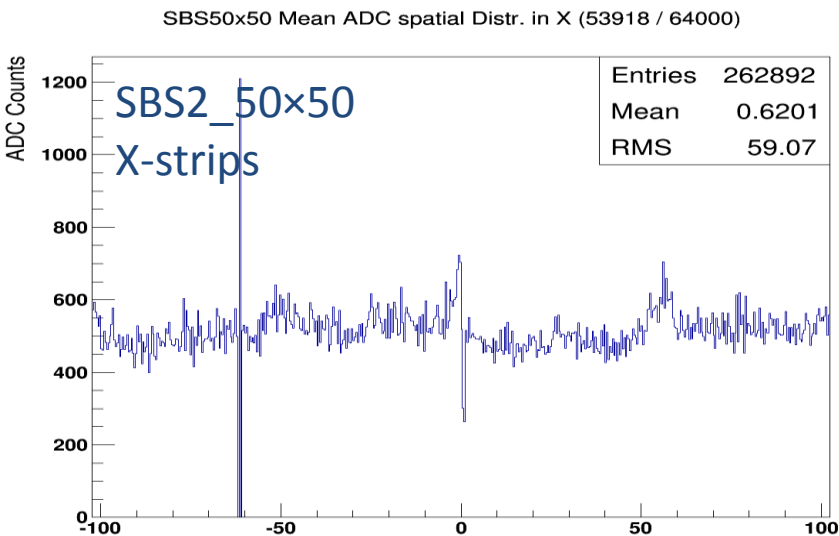

SBS60x50 cluster Charge Distr in Y-strips (59346 / 64000)

Saturation of the APV25

# UVa GEMs @ JLab Test Beam: Average ADC distribution vs cluster position

## Gain uniformity

# UVa GEMs @ JLab Test Beam: Cluster Multiplicity

Average number of cluster per event per detector plane

SBS50x50 cluster Multiplicity in X (53918 / 64000)

SBS50x50 cluster Multiplicity in Y (51937 / 64000)

SBS60x50 cluster Multiplicity in X (52010 / 64000)

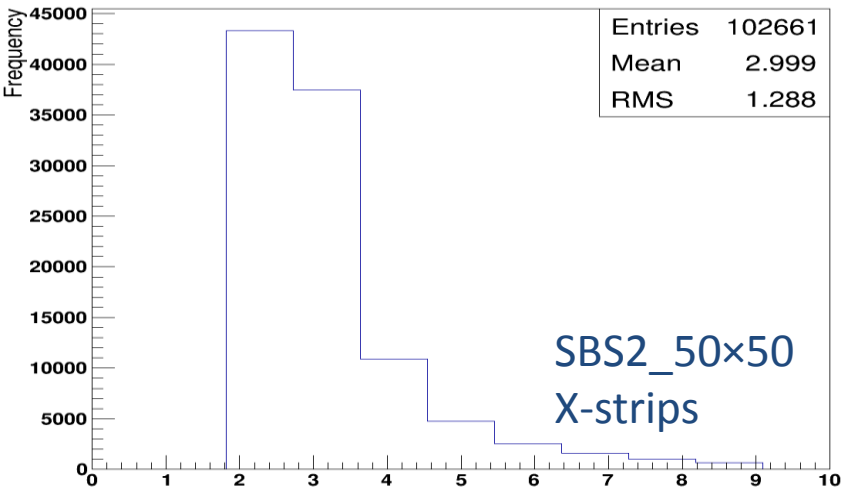

SBS60x50 cluster Multiplicity in Y (59346 / 64000)

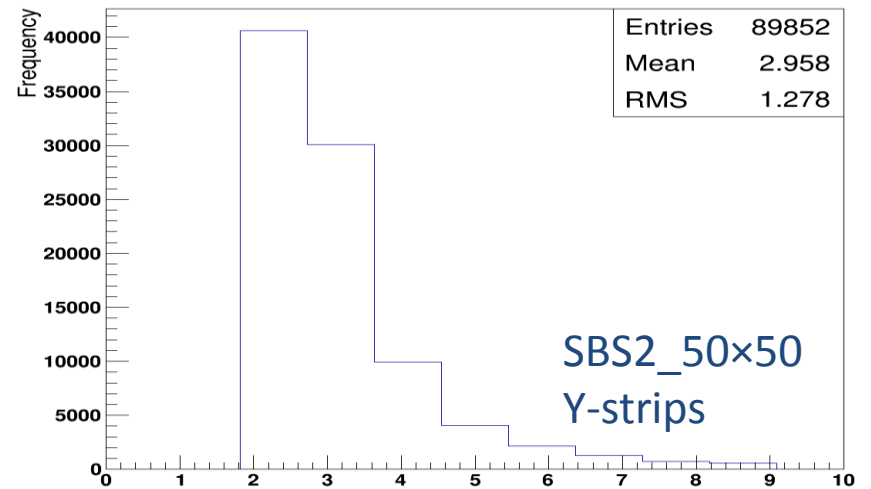

# UVa GEMs @ JLab Test Beam: Cluster Size

## Average number of hits per event cluster

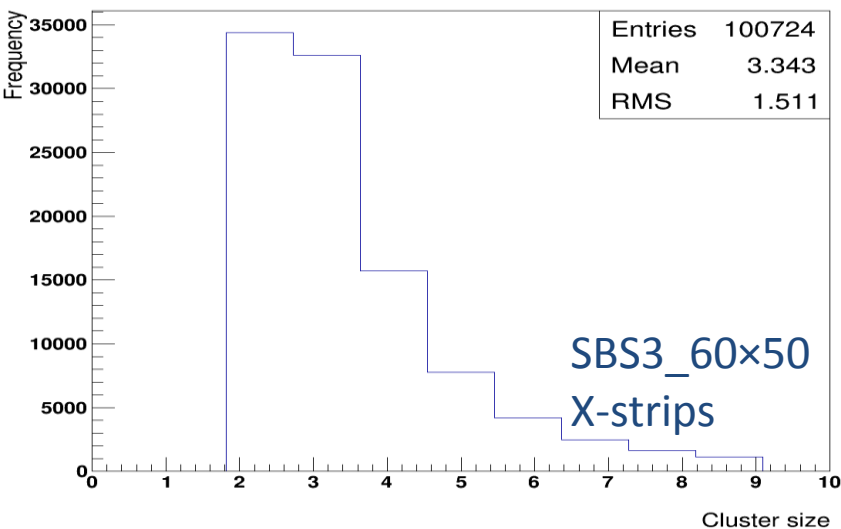

SBS50x50 cluster Size in X (53918 / 64000)

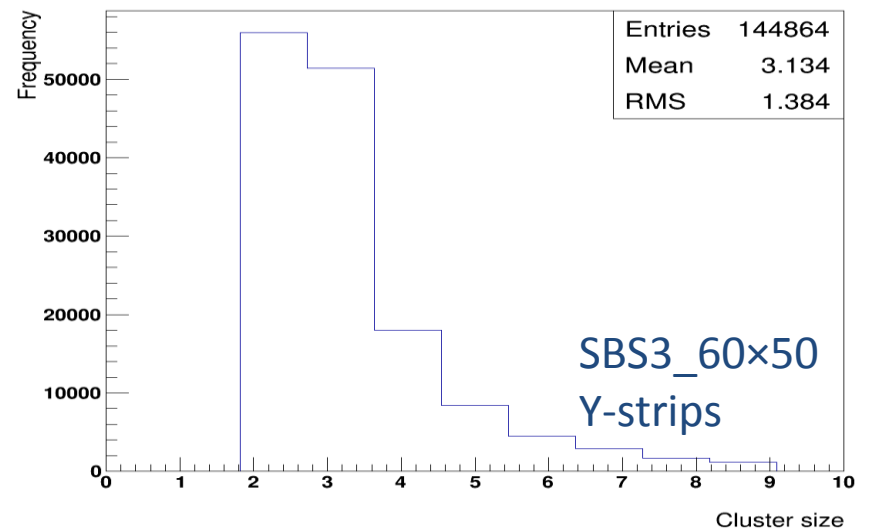

SBS50x50 cluster Size in Y (51937 / 64000)

SBS60x50 cluster Size in X (52010 / 64000)

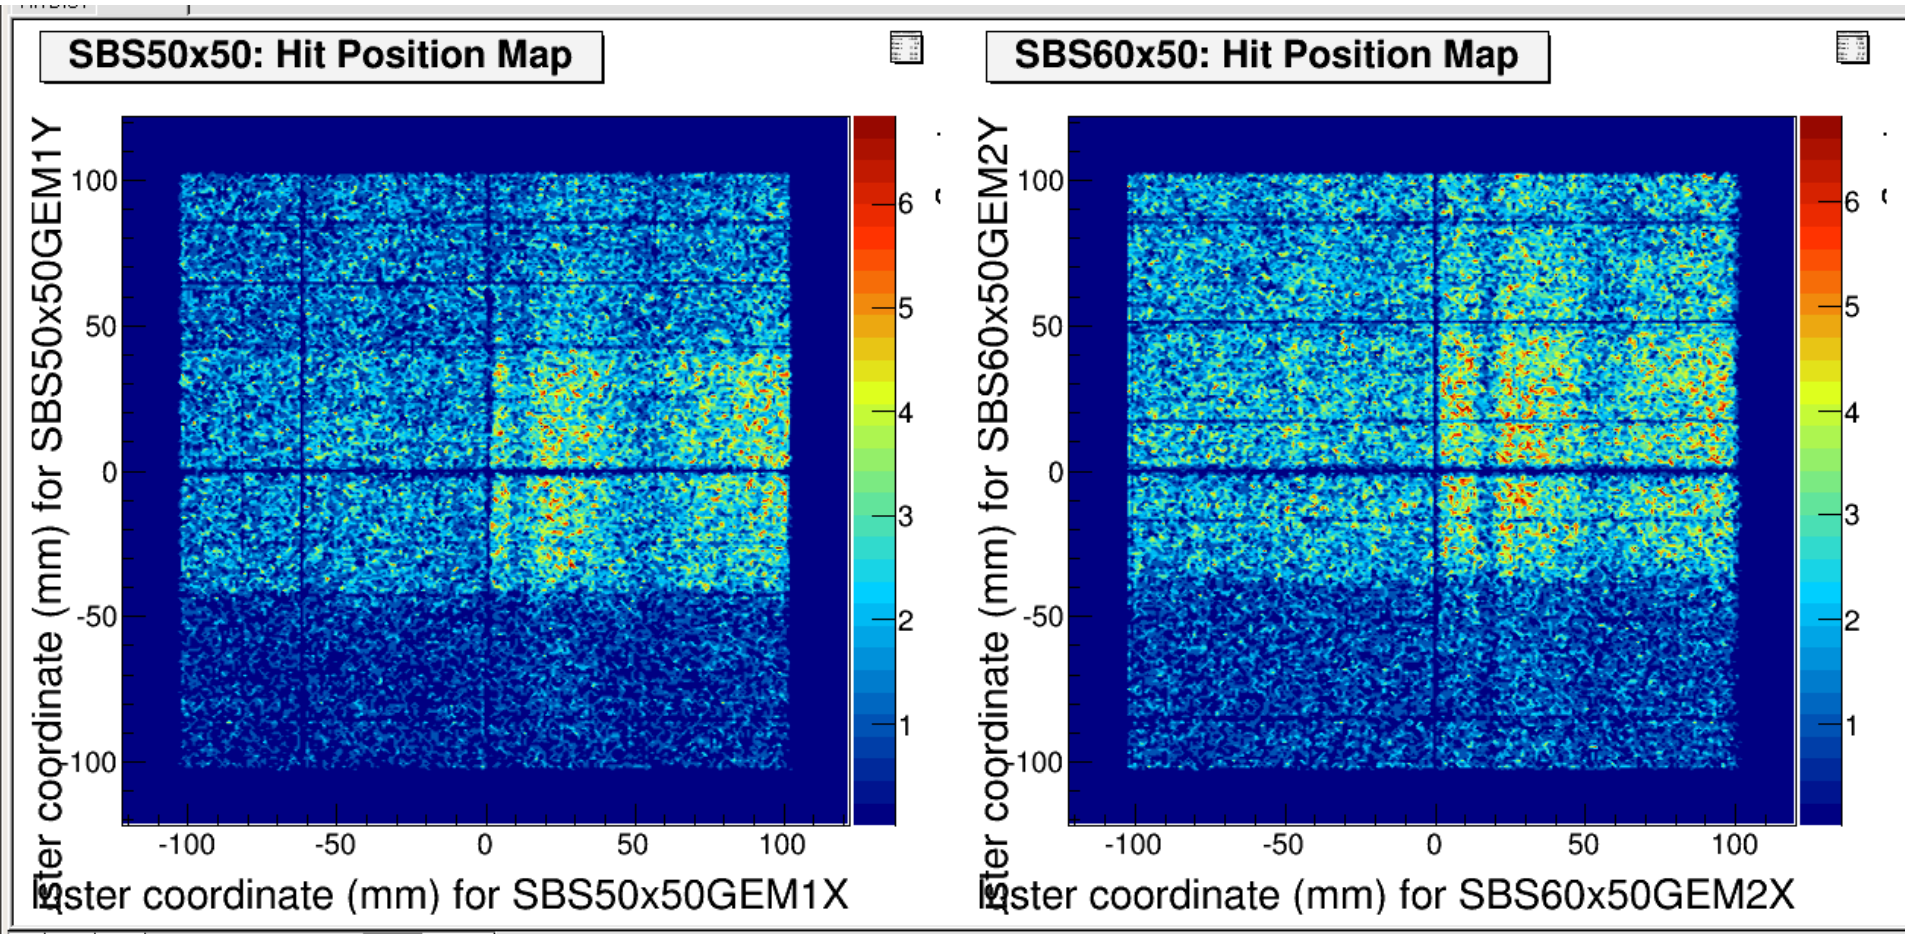

SBS60x50 cluster Size in Y (59346 / 64000)

# UVa GEMs @ JLab Test Beam: Cluster position map

# UVa GEMs @ JLab Test Beam: APV25 timing analysis

Very preliminary (Xinzhan Bai)

## 6TS JLab Data

Fitting of some Events in the Data

From the fit, we get the start data timing “apv latency” and the shaping time of the apv signal

20

# UVa GEMs @ JLab Test Beam: APV25 timing analysis

Very preliminary (Xinzhan Bai)

- Shaping time distribution over all apv25s: mean @ 57 ns (expected value is 50 ns)
- APV latency: delay between the apv trigger and the data → Need to adjust this measured parameter with the apv latency set by initializing the SRS
- Triggered particles → The pic at 15 ns → event synchronized with the trigger
- Background: remaining of the distribution

Strip raw hit start time

4/23/2014

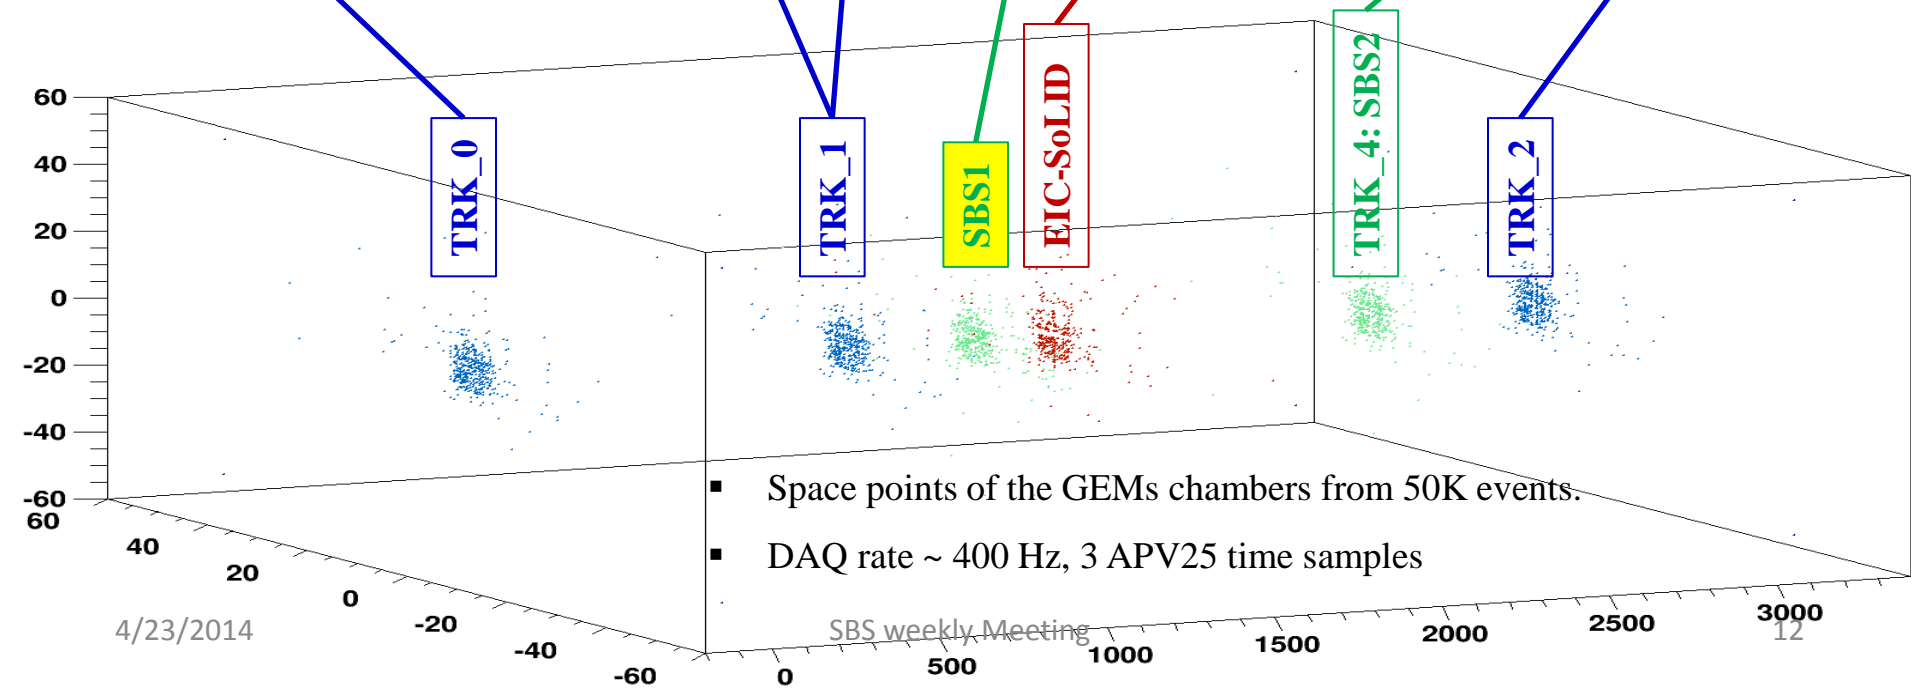

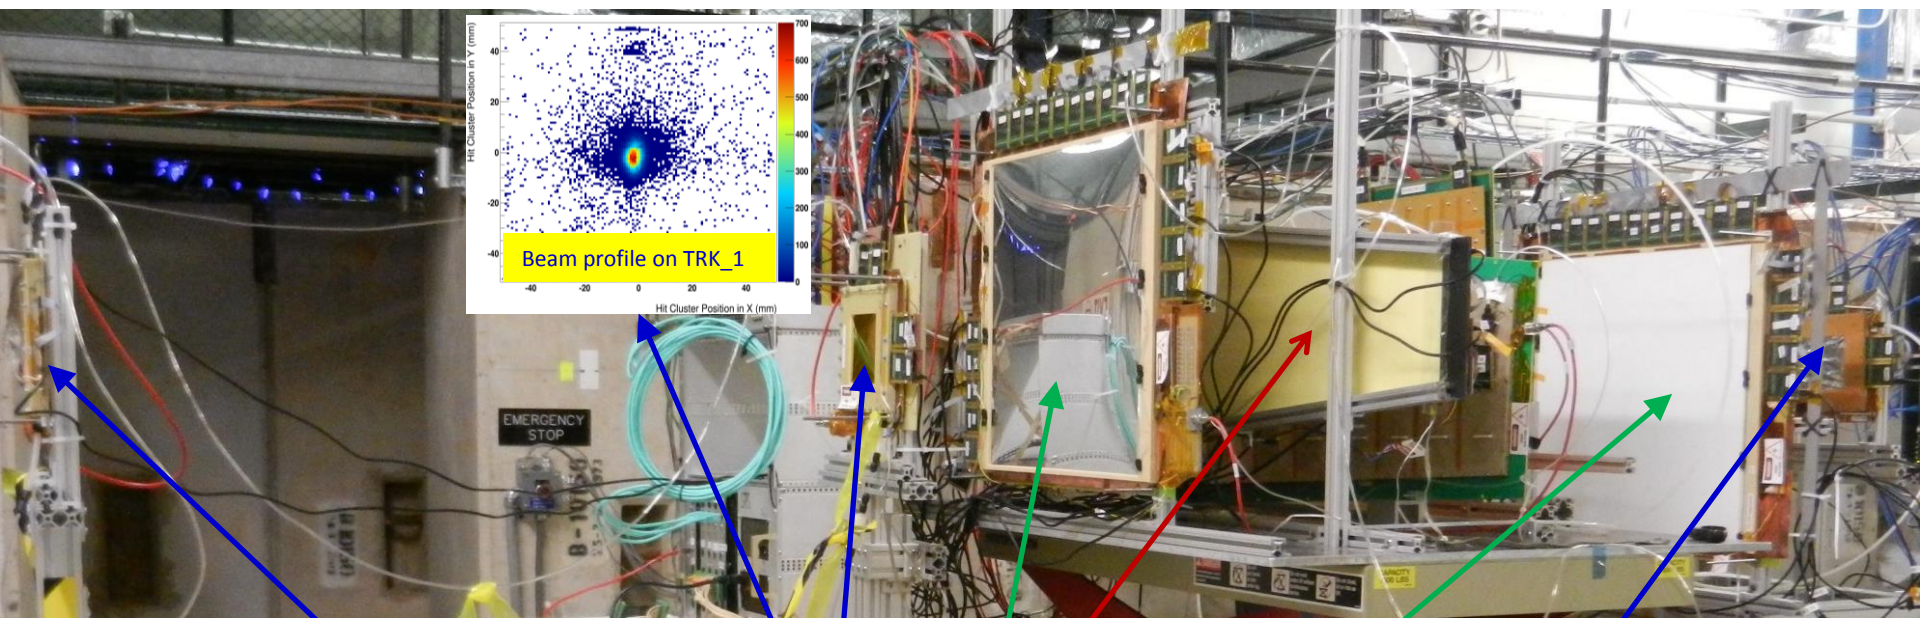

APV shaping time

SBS weekly Meeting

11

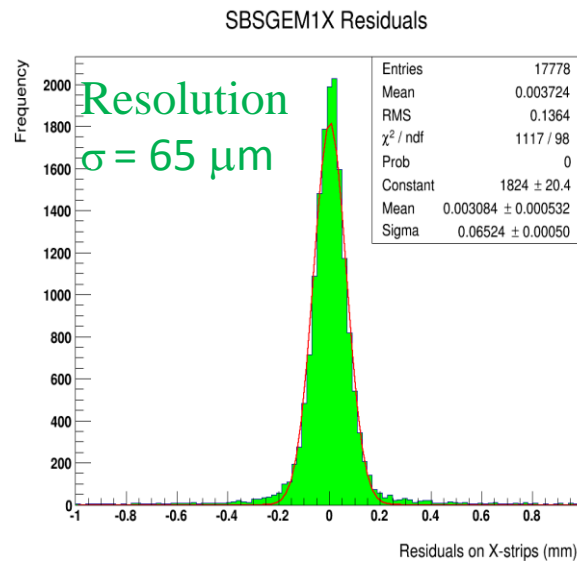

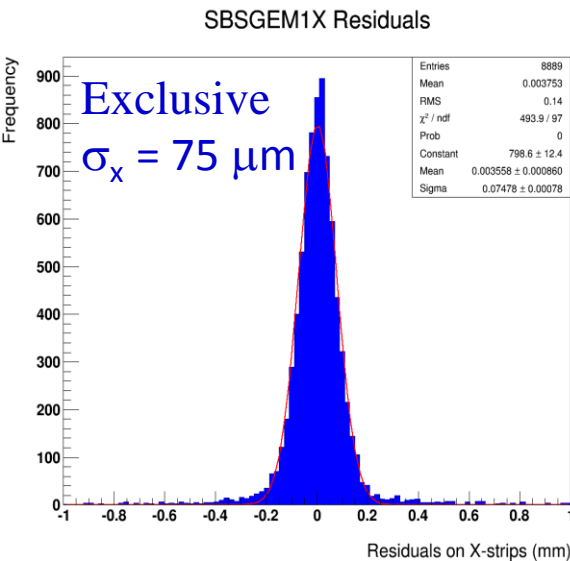

# UVa GEMs @ FNAL Test Beam (Oct. 2013): 120 GeV Proton Beam

# SBS1\_50×50: Resolution studies from track fit residuals

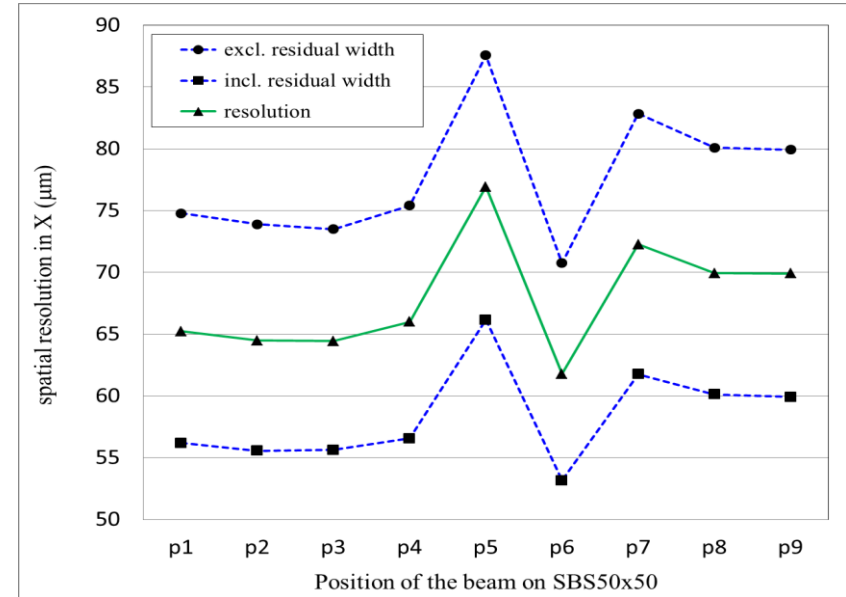

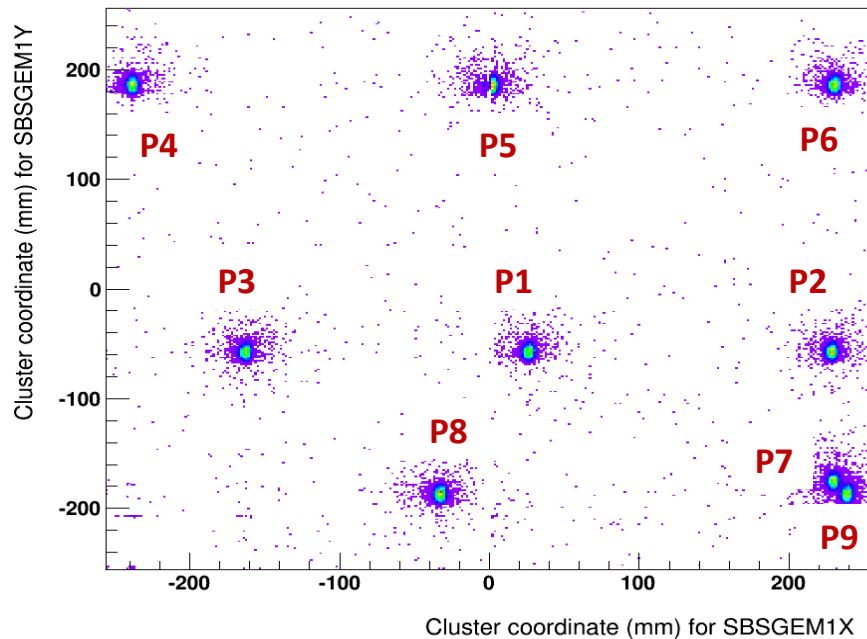

- **Tracking:** Linear fit in X and Y using the single hit from the 3 small trackers
- **Exclusive residual :** SBS1 data point excluded from the track fit
- **Inclusive residual :** SBS1 data used for the track fitting
- **Resolution:** Width ( $\sigma_{\text{resolution}}$ ) of the Gaussian fit to the combined exclusive and inclusive residual distribution:  $\sigma_{\text{resolution}} = \text{sqrt}(\sigma_{\text{exclusive}} \times \sigma_{\text{inclusive}})$

# SBS1\_50×50: Position scan & resolution

- Zero suppression:  $5 \times \sigma$  cut pedestal noise for each channel
- Clusterization: One or more hits per cluster
- HV: 4100 V on the voltage divider
- Uniform resolution over the 9 position scanned in X and Y
  - (75  $\mu\text{m}$  average for X-strips and 75  $\mu\text{m}$  for Y-strips)
- Pic on P5  $\rightarrow$  beam close to the spacers inside the chamber
  - Degradation of the resolution

SBS1 Hit Position Map

# SBS1\_50×50: Efficiency

- Uniform efficiency over the beam positions scanned
- Efficiency plateau around 4100 kV at 4 sigma cut
- Drop in efficiency at P5 → beam close to the spacers inside the chamber

Efficiency vs. HV on the divider

Efficiency @ different cuts (zero suppression)

# Choice of the zero suppression cut at $5 \times \sigma$ of the strip pedestal noise

SBS1\_50×50: 120 GeV proton beam
